Agricultural Survey: Agricultural Beef and Sheep Commodities: Year Ending 30 June 2007

Released at 11.30am (Canberra time) 6 June 2008

Explanatory Notes

More information on the ABS website

[7121.0 Agriculture Commodities, Australia, 2006-07](#)

[7125.0 Agricultural Commodities: Small Area Data, Australia, 2006-07](#)

Introduction

1. Estimates of 2006-07 farm production were based on information obtained from the Agricultural Survey conducted at 30 June 2007. The scope of the 2006-07 Agricultural Survey was essentially all agricultural businesses recorded on the Australian Business Register (ABR) maintained by the ATO. For the 2006-07 Agricultural Survey, the measure of size was the ABS' Estimated Value of Agricultural Operations (EVAO) where available; or where it was not available a Business Activity Statement (BAS) turnover size was derived. A minimum size cut-off of \$5,000, based on either EVAO or BAS Turnover, was used to determine whether a unit was in-scope for the Survey.

2. Statistics on area and production of crops relate in the main to crops sown during the year ended 30 June 2007. Statistics of perennial crops and livestock relate to the position as at 30 June 2007 and the production during the year ended on that date, or of fruit set by that date. Statistics for apples and pears and for grapes, which in some states are harvested after 30 June, are collected by supplementary collections and are included in this publication.

3. An agricultural establishment is the smallest accounting unit of business within a state or territory controlling its productive activities and maintaining a specified range of detailed data enabling value added to be calculated. In general, an establishment covers all operations at a physical location, but may consist of a group of locations provided they are within the same Statistical Local Area (SLA) or contiguous SLAs. The majority of establishments operate at one location only.

4. Values of zero within the spreadsheets, have the annotation 'nil or rounded to zero (including null cells)' and may indicate that the estimate is very small and has been rounded to zero, that no respondents have reported producing the particular commodity in that region or that, in the case of commodities with an area estimate but production of zero, there has been a crop failure. Blank cells may have the annotation 'n.p.', the abbreviation for 'not published' or the annotation 'n.a.' the abbreviation for 'not available'. The 'n.p.' abbreviation indicates that the data are unavailable in order to protect the confidentiality of a respondent(s). The 'n.a.' abbreviation indicates that the data are unavailable because the data were not

5. The estimates in this publication are based on information obtained from a sample drawn from the total agricultural business population in scope of the collection, and are subject to sampling variability; that is, they may differ from the figures that would have been produced if all businesses had been included in the Agricultural Survey. One measure of the likely difference is given by the standard error (SE) which indicates the extent to which an estimate might vary by chance because only a sample was taken. There are about two chances in three that a 'sample' estimate will differ by less than one SE from the figure that would have been obtained if all businesses had responded, and about nineteen chances in twenty that

6. In this publication, 'sampling' variability of the estimates is measured by the relative standard error (RSE), which is obtained by expressing the SE as a percentage of the estimate to which it refers. Annotations on the cells provide the range within which the RSE of the estimate falls. No annotation denotes estimates with RSEs of less than 10%.

7. Annotations:

n.p. not available for publication

^ This estimate has a relative standard error of between 10% and less than 25% and should be used with caution as they are subject to sampling variability too high for some purposes

* This estimate has a relative standard error between 25% and 50% and should be used with caution as it is subject to sampling variability too high for most practical purposes

** Estimate has a relative standard error greater than 50% and it is too unreliable for general use
