Executive Summary

H.W. Greenham & Sons sought to undertake a validation trial to take advantage of recent research that demonstrated it is possible to salvage burst beef paunches without compromising food safety. In addition, the Project sought to identify opportunities to maximise the financial return on other offal products.

A workshop and validation trial were undertaken. The two-day workshop was held to skill staff on research into offal recovery opportunities, identify losses, calculate the financial opportunities and prioritise action for improvement. Sixteen Greenham Staff attended the Offal Yield Improvement workshop on August 17 2002. Key outcomes included:

- Tracking offal was the biggest single issue at the Tongala plant.
- It is essential to allow operatives to contribute to the improvement process.
- The incidence of dropped tails needs to be reduced.
- The correct method of hanging of tongues needs to be employed.

The validation trial tested the null hypothesis that:

1. The microbiological counts of scalded rumen tripe from burst paunches did not differ from those of intact paunches; and
2. The microbiological counts of unscalded rumen pillars from burst paunches did not differ provided that the same sampling techniques were followed. A total of 200 samples were collected for analysis of Standard Plate Count (SPC), Coliforms and *E.coli*. All pathogen analyses were acceptable. The only difference of significance related to total counts for tripe for “all data” and for samples from “Room 1”. However, the difference was not meaningful given that the counts overall were very low. Data were also compared with data from the offal.com project. Tripe SPC counts from the Tongala Plant were much lower than those reported in the offal.com project.

Alternative procedures for collecting burst paunches were devised to enable H.W. Greenham & Sons to further comply with the AQIS Meat Notice 2001 / 21 “Enhanced Recovery of Green Offals at Exporting Slaughtering Establishments”. Only small amendments to existing work instructions were required.

H.W. Greenham & Sons have demonstrated equivalence to meet AQIS requirements and have shown that the pathological counts of rumen pillars and tripe from burst paunches do not differ from those of intact paunches. As such, it is recommended that H.W. Greenham & Sons be allowed to salvage beef paunches, subject to final AQIS inspection, for further processing.

This Project has also resulted in the following additional benefits to H.W. Greenham & Sons operations:

1. A reduction in the condemnation of beef paunches;
2. An increase in the financial returns from beef paunches; and
3. Identification of opportunities to maximise returns from other offal products.

1. Introduction

Recent work funded by Meat & Livestock Australia (MLA-Offal-com) and undertaken by the University of Queensland has scientifically demonstrated that it is possible to salvage burst beef paunches without compromising food safety.

H.W. Greenham & Sons sought to undertake a validation trial on plant to take advantage of this recent research. In addition H.W. Greenham & Sons sought to identify opportunities to maximise the financial return on other offal products through further research and innovation.

This report details the successful development and validation of enhanced recovery protocols for burst paunches at H.W. Greenham & Sons in order to demonstrate to AQIS compliance with Meat Notice 2001/21 " Enhanced Recovery of Green Offals at Export Slaughtering Establishments". In addition, it details opportunities to maximise the return of offal products.

2. Objectives

The objectives of this Project were:

- to undertake an offal recovery workshop with relevant staff to identify, from a cost benefit analysis, opportunities for research into offal products based on their potential for increased recovery;
- to skill relevant staff to undertake research into offal recovery and to implement identified improvement processes;
- to specifically identify the current losses at H.W. Greenham & Sons during beef paunch recovery;
- to develop procedures for the collection of beef burst paunches for inclusion within the company's Meat Safety Quality Assurance (MSQA);
- to conduct a validation trial to confirm that the new offal recovery procedures meet microbiological food safety hazards at a level consistent with industry or benchmark standards; and
- to prepare a report on the outcome of the validation trial for presentation to Australian Quarantine and Inspection Service (AQIS).

3. Methodology

3.1 Workshop

A two-day workshop was held to skill staff on research into offal recovery opportunities, identify losses, calculate the financial opportunities and prioritise action for improvement. A spreadsheet program was provided to allow staff to easily identify losses and calculate gross margins for offal recovery.

3.2 Alternative Procedure For Collecting Burst Paunches

Re-evaluation of H.W. Greenham & Sons HACCP procedures were required to ensure the procedures required to recover burst paunches are validated and that every endeavour is made to demonstrate a reduction in the incidence of burst paunches over time. Full procedures (monitoring, corrective action and action limits) for controlling the contamination risk to carcasses, green and red offals need to be reached and implemented.

3.3 Validation Of Alternative Procedures

To confirm the new procedures and demonstrate equivalence to meet AQIS requirements a validation trial was required. The null hypotheses of the trial were that

The microbiological counts of scalded rumen tripe from burst paunches do not differ from those of intact paunches.

The microbiological counts of unscalded rumen pillars from burst paunches do not differ from those of intact paunches.

Technical assistance from Alliance Consulting & Management (Alliance) ensured adequate sampling techniques were followed. A sampling protocol was devised as follows, and samples submitted to a NATA accredited laboratory for analysis (Symbio Laboratories, East Brisbane QLD). A total of 200 samples were collected for analysis. The sampling plan for the validation is provided in Annex 1.

3.3.1 Sampling of Tripe

- Five samples each of scalded tripe from burst paunches and intact paunches were collected immediately before packing on a daily basis for three consecutive days (morning and afternoon) from each of the two rooms processing paunches over a two week period.
- For each sample approximately 200 grams of tripe was removed aseptically and placed in a sterile plastic bag.
- All plastic bags were sealed and placed in an insulated container with refrigerated cooler bricks.

3.3.2 Sampling of Rumen Pillars

- Five samples each of Rumen Pillars from burst paunches and intact paunches were collected immediately before packing on three different days (morning and afternoon) from each of the two rooms processing paunches over a two week period.
- For each sample approximately 200 grams of Rumen Pillars was removed aseptically and placed in a sterile plastic bag.
- All plastic bags were sealed and placed in an insulated container with refrigerated cooler bricks.

Samples were sent to Symbio Laboratories for analysis of Standard Plate Count (method M2.1 reference AS1766.1.3 – 1991), Coliforms (method M8.8 reference AOAC 991.14) and *E. coli* (method M8.8, reference AOAC 991.14).

All data was analysed by Alliance Consulting & Management for statistical significance after conversion of microbial counts to their respective \log_{10} values, and two sample t-tests (assuming equal variances) were performed to evaluate microbiological differences between burst and intact paunches for Standard Plate Count, Coliforms and *E. coli*. Where microbes were not detected they were given the value of 1 cfu to enable a \log_{10} value to be determined (ie'0'). Because of the high occurrence of non-detections, the frequency of occurrence of coliforms and *E.coli* was examined between treatment groups using Chi² analysis.

4. Results & Discussion

4.1 Workshop

Sixteen (16) Greenham Staff attended the Offal Yield Improvement workshop on August 17 2002, delivered by Alliance Consulting & Management and were issued with certificates of attendance. A list of those attending is provided in Annex 2.

The workshop covered the following areas:

- Importance of offal recovery:
 - importance of offal to your business;
 - calculating the gross margins; and
 - opportunity for improvement in offal yield;
- Maximising yield in offal recovery:
 - what factors influence yield in offal recovery?
- Offal microbiology:
 - microbes in general/major microbe groups;
- Factors affecting microbe growth;
- Pre-slaughter and slaughter handling procedures;
- Techniques for improving yield:
- Product descriptions:
 - points of specification/trimming to customer requirements;
- Chilling and freezing;
- Packaging of offal;
- Offal yield benchmark;
- Validation of current or alternative procedures;

Outcomes from the initial workshop and observations by Alliance Consulting & Management included:

- How offal is tracked is the biggest single issue at the Tongala Plant. While the existing system of counting the pieces provides a certain amount of information it only addresses the number of items lost or condemned. In essence, 100% of the items could be recovered without any yield difference due to incorrect trim of cutting lines being known. To improve this situation, it was recommended that recovery weights be benchmarked against the tables supplied in the workbook, which expresses the weight of each item as a percentage of carcase weights. Once

benchmark percentages are established then calculate total weights of each item recovered for a shift or day.

- It is essential to allow operatives to contribute to the improvement process. An example of this was the suggestion by one of the participants during the workshop to aggregate part cartons of cheek meat from the two chains at the end of each shift.
- The incidence of dropped tails needs to be reduced with the interim solution being for the operative to take as much care as time restraints allow, however ongoing consultation with all personnel involved needs to identify how the process can be improved.
- The correct method of hanging of tongues needs to be employed by both chains. One chain was pushing the draining hook right through the blade of the tongue resulting in damage to each tongue. While this is not an issue for the current customer, some high quality markets will object.

4.2 Alternative Procedure For Collecting Burst Paunches

H.W. Greenham & Sons have re-evaluated their HACCP plan, paying particular attention to:

- Identification and separation of carcasses potentially contaminated due to a burst paunch using a tagging system.
- The probable difference in burst rates for different classes of stock and the implications for managing contamination.
- The separation of red offals from other offals to ensure red offals are not contaminated.
- The presentation of all offals to AQIS inspectors to ensure that the contaminated paunches do not represent a risk to other uncontaminated product as a result of the required inspection procedures.
- The removal of edible green offal from the viscera barrow to ensure cross contamination of edible offal is prevented.
- The operational hygiene and cleaning of the viscera barrow.

Most of the issues were already covered in existing work instructions. Revised (WI-11.2.2.8) and existing (WI-11.2.2.7) work instructions covering burst paunch requirements are attached (Annex 3).

4.3 Validation

A total of 200 samples were collected for analysis using the sampling protocol detailed in 3.3. Tripe and Pillar products were collected in Room 1 and Room 2 on three different days during the morning and afternoon shifts. Detailed microbiological results are provided in Annex 1. The following analyses were undertaken:

1. All data from Room 1 and Room 2 (tripe)
2. All data from Room 1 and Room 2 (pillars)
3. Data from Room 1 (tripe)
4. Data from Room 1 (pillars)
5. Data from Room 2 (tripe)
6. Data from Room 2 (pillars)

The frequency of occurrence of pathogens as indicated by *E.coli* did not differ significantly between treatments (Table 1).

Table 1: Frequency of occurrence of E.coli on processed burst paunches compared with numbers on intact paunches by offal room

| <i>E.coli</i> (\log_{10} cfu/g) | Intact | Burst |
|------------------------------------|------------|------------|
| Room 1 - Tripe | | |
| Not detected | 32 | 40 |
| 0.01 – 1.00 | 0 | 8 |
| 1.01 – 2.00 | 48 | 36 |
| 2.01+ | 20 | 16 |
| TOTAL | 100 | 100 |
| Room 2 – Pillars | | |
| Not detected | 12 | 20 |
| 0.01 – 1.00 | 4 | 4 |
| 1.01 – 2.00 | 32 | 32 |
| 2.01+ | 52 | 44 |
| TOTAL | 100 | 100 |
| <i>E.coli</i> (\log_{10} cfu/g) | Intact | Burst |
| Room 2 - Tripe | | |
| Not detected | 100 | 92.0 |
| 0.01 – 1.00 | 0 | 4.0 |
| 1.01 – 2.00 | 0 | 4.0 |
| 2.01+ | 0 | 0 |
| TOTAL | 100 | 100 |
| Room 2 – Pillars | | |
| Not detected | 20.0 | 36.0 |
| 0.01 – 1.00 | 8.0 | 0 |
| 1.01 – 2.00 | 40.0 | 36.0 |
| 2.01+ | 32.0 | 28.0 |
| TOTAL | 100 | 100 |

Differences in the mean microbial counts between treatment groups are provided in Tables 2 – 4 for all data (Table 2), Room 1 (Table 3) and Room 3 (Table 4).

Table 2: Mean numbers of bacteria on processed burst paunches compared with numbers on intact paunches (all data)

| | Intact (log ₁₀ cfu/g) | Burst (log ₁₀ cfu/g) | Significance |
|-----------------------------|-------------------------------------|------------------------------------|--------------|
| <i>Total Bacteria (SPC)</i> | | | |
| Tripe | 2.96 | 3.21 | P<0.05 |
| Pillars | 3.62 | 3.62 | ns* |
| <i>Coliforms</i> | | | |
| Tripe | 0.65 | 0.65 | ns |
| Pillars | 1.94 | 1.71 | ns |
| <i>E.coli</i> | | | |
| Tripe | 0.59 | 0.57 | ns |
| Pillars | 1.88 | 1.70 | ns |

Table 3: Mean numbers of bacteria on processed burst paunches compared with numbers on intact paunches (Room 1)

| | Intact (log ₁₀ cfu/g) | Burst (log ₁₀ cfu/g) | Significance |
|-----------------------------|-------------------------------------|------------------------------------|--------------|
| <i>Total Bacteria (SPC)</i> | | | |
| Tripe | 2.94 | 3.21 | P<0.05 |
| Pillars | 3.65 | 3.76 | ns |
| <i>Coliforms</i> | | | |
| Tripe | 1.19 | 1.13 | ns |
| Pillars | 2.24 | 2.14 | ns |
| <i>E.coli</i> | | | |
| Tripe | 1.19 | 1.05 | ns |
| Pillars | 2.21 | 2.13 | ns |

Table 4: Mean numbers of bacteria on processed burst paunches compared with numbers on intact paunches (Room 2)

| | Intact (log ₁₀ cfu/g) | Burst (log ₁₀ cfu/g) | Significance |
|-----------------------------|-------------------------------------|------------------------------------|--------------|
| <i>Total Bacteria (SPC)</i> | | | |
| Tripe | 2.97 | 3.21 | ns |
| Pillars | 3.59 | 3.47 | ns |
| <i>Coliforms</i> | | | |
| Tripe | 0.11 | 0.18 | ns |
| Pillars | 1.64 | 1.28 | ns |
| <i>E.coli</i> | | | |
| Tripe | 0.00 | 0.09 | ns |
| Pillars | 1.54 | 1.26 | ns |

All pathogen analyses were acceptable. The only difference of significance related to total microbial counts for tripe for “all data” and for “Room 1”. However, the difference is not meaningful given that the mean counts between treatment groups only differed by 0.25 and 0.26 log respectively. Data were also compared with data from the offal.com project. Tripe SPC counts from the Tongala Plant were much lower than those reported in the offal.com project (Table 5).

Table 5: Comparison of SPC counts for tripe – Tongala vs Offal.com

| Tripe | Tongala – all data SPC (log ₁₀ CFU/g) | Offal.com project APC (log ₁₀ CFU/cm ²) |
|--------------|---|---|
| Baseline | 2.96 | 3.55 |
| Burst paunch | 3.21 | 3.55 |

5. Conclusions & Recommendations

H.W. Greenham & Sons have demonstrated equivalence to meet AQIS requirements by this validation trial and has showed that the pathological counts of rumen pillars and tripe from burst paunches do not differ from those of intact paunches.

Given this result, it is recommended that H.W. Greenham & Sons be allowed to salvage beef paunches, subject to final AQIS inspection, for processing.

This Project has resulted in the following benefits to H.W. Greenham & Sons operations:

1. A reduction in the condemnation of beef paunches;
2. An increase in the financial returns from beef paunches; and
3. Identification of opportunities to maximise returns from other offal products.
