

Grass that lasts – Growing perennial pastures in a variable climate

PDS Updates webinar series

 **29 October 2026 | Time 12pm AEDT**

 Online via Microsoft Teams

Better preparation. Better establishment. Better outcomes.

Establishing perennial pastures is a significant investment, but what management decisions help set paddocks up for long-term success?

Join MLA's next PDS Updates webinar and hear practical lessons from producers who have spent six years demonstrating perennial pasture establishment and management under commercial farming conditions.

Together with project facilitator Alison Gunn, producers Dave Caldwell, Emily Richardson and Ron Cornall will share what they learnt about moisture conservation, weed control, pasture establishment and grazing management, and why the decisions made before sowing often had the biggest impact on long-term pasture performance.

What you'll hear about

- Lessons from six years of demonstrating perennial pasture establishment and management under commercial conditions
- Why moisture preservation, weed control and paddock preparation are critical to protecting pasture investment
- The establishment and management practices that helped support productive and persistent perennial pastures
- Producer experiences managing perennial pastures through variable seasons, including what worked and what they'd do differently
- Practical take-home ideas to help inform your next pasture renovation decision

Whether you're planning your next pasture renovation or looking to get more from your existing perennial pastures, this webinar will share practical producer experiences and lessons you can apply in your own operation.

This webinar is delivered by Meat & Livestock Australia in collaboration with Herd Solutions, and the Gippsland Agriculture Group.
